1.0 Introduction

Natural Resource Solutions Inc. (NRSI) was retained by HDR Inc. (the Client) on behalf of the City of Mississauga to complete a tree inventory and Tree Preservation Plan (TPP) for the proposed reconstruction of Ninth Line, in Mississauga, Ontario, as part of a Municipal Class Environmental Assessment (EA). The study area is composed of the road right-of-way (ROW) from Eglinton Avenue West to Derry Road West (approximately 6.2km) and up to 5-6m beyond the existing ROW. Ninth Line is an arterial road bordered by residential subdivisions along the east side; commercial, agricultural, residential, and natural lands border the road to the west.

This report has been prepared in accordance with the City of Mississauga's Tree Preservation and Protection Standards (revised 2019), and the City's Terms of Reference for Arborist Reports, Tree Inventory/Survey & Tree Preservation Plans (2020). The Private Tree Protection By-law 254-12 regulates trees on private lands within City limits. Within that By-law, a tree is defined as, "a self-supporting woody plant which may reach a height of at least 4.5 metres at maturity".

The tree inventory data and mapping has been compared to the layout of the preliminary grading and reconstruction plan prepared by HDR Inc. Map 1 shows the proposed elements of the reconstruction, grading limits, proposed road ROW, and inventoried trees. The location of trees, their overall health and/or potential for structural failure at the time of assessment was compared to the layout and grading details to determine whether existing trees would be impacted by the proposed undertaking. Avoidance, mitigation, and protection measures for trees were considered to determine which trees would be impacted and which could be retained. In the case of trees requiring removal, compensation for removal is discussed according to City requirements.

This report summarizes the following:

- Findings of the tree inventory;
- Assessment of overall health and potential for structural failure of inventoried trees;
- Tree retention analysis based on details of the proposed works;
- Protection measures for trees to be retained; and
- Recommended mitigation and compensation.

2.0 Tree Inventory and Methods

A comprehensive inventory of trees ≥10cm in diameter at breast height (DBH) in the Ninth Line ROW of the study area and trees whose dripline overlapped the ROW was completed by NRSI Certified Arborists on March 17 and April 2, 7, 8 & 9, 2020. Trees within public ROWs at intersecting streets were also inventoried up to approximately 15m from Ninth Line. The inventory included an assessment by a Certified Arborist, and recording the location of each inventoried tree with an SXBlue II GNSS GPS unit. A complete list of the trees that were assessed and their overall health and potential for structural failure is provided in Appendix I and their location is shown on Map 1.

The overall health of each tree and potential for structural failure was assessed based on the criteria outlined in Appendix II, and the following information was recorded for inventoried trees:

- Tree location;
- Species (common and scientific name);
- DBH (cm);
- Crown radius (m);
- General health (excellent, good, fair, poor, very poor, dead);
- Potential for structural failure (improbable, possible, probable, imminent);
- Potential cavities that could be used by Species at Risk (SAR) bats;
- General comments (i.e. disease, aesthetic quality, development constraints, sensitivity to development, etc.).

The DBH of multi-stemmed trees is presented as the square root of the sum of each stem's diameter squared, as per the approach outlined in the Terms of Reference (City of Mississauga 2020). In the same document, trees are to be assigned overall condition ratings of "good, fair, poor, and dead", but these categories are not defined. Therefore, during the field assessments, Certified Arborists used the criteria in Appendix II; any trees assessed as "excellent" or "very poor" based on Dunster (2009) can be considered "good" or "poor", respectively.

In carrying out these assessments, NRSI has exercised a reasonable standard of care, skill and diligence as would be customarily and normally provided in carrying out these assessments. The assessments have been made using accepted arboricultural techniques. These include a visual examination of each tree for structural defects, scars, external indications of decay such as fungal fruiting bodies, evidence of insect attack, the condition of any visible root structures,

the degree and direction of lean (if any), the general condition of the tree(s) and the surrounding site, and the current or planned proximity of property and people. None of the trees examined were dissected, cored, probed or climbed, and detailed root examinations involving excavation were not undertaken. The conditions for this assessment, including restrictions, professional responsibility and third-party liability can be found in Appendix III.

2.1 Limitations

It should be noted that additional landscape trees less than 10cm DBH may require removal due to conflicts with the proposed undertaking, but these smaller trees were outside the scope of the inventory, as per the Request for Proposals (Procurement # PRC001796), and are not addressed in the discussion or mapping of this report. Additionally, the preferred Preliminary Design proposes, in some areas, road improvement works beyond the existing ROW, and the widening of the existing ROW in places. As a result, some trees that were outside the original scope of the tree inventory may be impacted by the proposal. This includes trees along the road-facing edge of three woodland features, located on the west side of Ninth Line, across from Erin Centre Boulevard, across from Osprey Boulevard, and south of Derry Road West. Impact to un-inventoried trees is also possible in other parts of the study area, especially in places where the Ninth Line ROW is immediately adjacent to the ROW of other streets that run parallel. Please refer to Section 4.1 for further information.

2.2 Bat Habitat Assessment Methods

Four bat species are listed as Endangered provincially and are afforded general habitat protection under the *Endangered Species Act, 2007* (OMNRF 2020). Three of these bat Species at Risk (SAR) are known to roost in tree cavities, hollows, or under loose bark, as well as within buildings (OMNR 2000): Little Brown Myotis (*Myotis lucifugus*), Northern Myotis (*Myotis septentrionalis*), and Tri-colored Bat (*Perimyotis subflavus*).

Records of bat species occurrence in the province are not comprehensive, so as part of the tree health assessments, NRSI's Certified Arborists, who are trained and experienced in the Ministry of Natural Resources and Forestry (MNRF) bat habitat assessment protocols (MNRF 2014, MNRF 2017), visually scanned all trees ≥10cm DBH for the presence of features (i.e. cavities, loose bark, etc.) that may provide bat maternity colony habitat.

Information considered (and recorded, where applicable) for cavity trees included tree species, location, DBH, canopy cover, tree height, decay class according to Watt and Caceres (1999),

and number of potentially suitable cavities. Other criteria were also considered, including the use of cavities by other wildlife, the potential for cavities to be used by predators, supporting/surrounding habitat, and other characteristics which may contribute to the habitat requirements of these species, such as temperature regulation.

3.0 Summary of Tree Inventory Findings

In total, 983 trees were inventoried, comprising 40 species. Of the trees inventoried and assessed, 274 (28%) are native species and 699 (71%) are non-native, while 10 were not identified to the species level. The large proportion of non-native trees can be attributed to landscaping/streetscaping choices favouring commonly available and commonly planted species, performing desirable functions of street trees. For example, some species selected exhibit high salt tolerance and some effective screening of adjacent yards. Approximately 90% of trees inventoried are public trees within the ROW or trees of shared ownership, overlapping public and private property. Colorado Spruce (*Picea pungens*) accounts for 52% of trees inventoried and is found in long rows, mostly along linear municipal landscaping easements along the east ROW limits. Norway Maple (*Acer platanoides*) occurs next most frequently, with 50 individuals. More than 75% of trees inventoried are landscape trees planted along the east side of the Ninth Line ROW.

A complete list of inventoried trees is provided in Appendix I and tree locations within the study area are shown on Map 1. Appendix IV provides 2 tables that summarize the inventory data based on species and condition.

3.1 Bat Habitat Findings

During the tree inventory, NRSI documented four trees with cavity features that could potentially provide bat maternity roosting habitat. Each of these four trees (#755, 844, 845, 893) are at the frontage of residential properties along the west side of Ninth Line, outside of natural features. Refer to sections 5.2.6 and 6.4.2 of the Natural Environment Assessment (NRSI 2021) for further discussion of potential habitat for bat SAR.

4.0 Tree Removal and Retention Analysis

Tree removal and retention was based on two considerations:

1) Trees that require removal based on the extent of proposed construction and site grading. This was determined by comparing the location of the trees to the location of the components of the plan as shown on Map 1;
2) Trees identified as being very poor or dead, with a probable or possible potential for structural failure. The removal of these trees has been recommended for safety, especially if they are located within striking distance of a component of the proposed development, or existing off-site sidewalks, roads or buildings.

Of the 983 trees inventoried, 658 are anticipated to be removed. Of the 658 anticipated to be removed, 7 are recommended for removal as a result of their condition and position which may pose a public hazard.

The remaining 651 trees are anticipated to be removed based on the extent of the proposed construction and site grading. Many of these are in direct conflict with the proposed road reconstruction and construction of pedestrian/cyclist infrastructure and utility corridors. Trees situated along the grading limit or in close proximity that may incur severe root damage as a result of grading have also been recommended for removal. Most of the trees anticipated to be removed based on the extent of the proposal are in good to fair health with an improbable potential for structural failure, and range in size from 10.0cm DBH to 122.8cm DBH.

Based on the design drawing used in Map 1, most of the inventoried trees are rooted within the Ninth Line ROW or in narrow landscape planting easements. According to Section 10 of the *Forestry Act* (R.S.O. 1990, c. F.26), a tree whose trunk grows on the boundary between adjoining lands is the common property of the owners of the adjoining lands. Thirty trees anticipated to be removed are considered boundary trees, jointly owned by the City and adjacent landowners, and 59 trees anticipated to be removed are private property. Prior to the removal of these trees ownership should be confirmed and consent secured from the appropriate owner(s). Since inventoried trees have not been identified in the field with forestry tags, it is recommended that trees be clearly marked for removal by a Certified Arborist prior to removals beginning.

In the case of trees requiring removal, a compensation strategy is discussed further in Section 5.0. Appendix I provides details of trees inventoried, including tree preservation analysis and

rationale for removal. Map 1 identifies trees proposed to be retained or removed based on the preliminary design and grading requirements.

4.1 Impacts Beyond the Scope of Tree Inventory

The original scope of the tree inventory field work assumed that road improvement works would not exceed the limits of the existing ROW. Since the preferred Preliminary Design proposes, in some areas, road improvement works beyond the existing ROW and the widening of the existing ROW in places, some trees that were outside the original scope of the tree inventory may be impacted by the proposal. It is recommended that supplementary tree inventory take place in support of the Detailed Design in order to fully assess impacts to trees in the study area. The specific areas in which further impact or removals may occur include:

- At the edges of woodland features across from Erin Centre Boulevard, across from Osprey Boulevard, and south of Derry Road West. Refer to section 8.3.1 of the Natural Environment Assessment (NRSI 2021) for a discussion of anticipated impacts to woodland edge zones;
- along Windhaven Drive;
- along Bloomington Crescent;
- around the 7 Eleven north of Thomas Street;
- along Arbourview Terrace;
- at the end of Regatta Court;
- on either side of Deepwood Heights;
- along Talias Crescent;
- between Janice Drive and Henrietta Way;
- between Burdette Terrace and Erin Centre Boulevard;
- in front of 5400 Ninth Line; and
- in front of 5578 Ninth Line.

5.0 Tree Compensation Plan

The City of Mississauga's Urban Forest Management Plan describes the importance of the urban forest and cites a study that estimates the City's urban forest provides more than $6 million worth of environmental services each year (City of Mississauga 2014). Accordingly, to mitigate the loss of existing trees, City policies have set out replacement requirements for trees removed as part of construction projects or developments.

The Terms of Reference for Arborist Reports, Tree Inventory/Survey & Tree Preservation Plans indicates that, as part of the tree removal permit process, healthy trees removed from private property are to be replaced at a ratio of 1:1 for trees <50cm DBH and 2:1 for trees ≥50cm DBH (City of Mississauga 2020). Therefore, those trees assessed as in poor or very poor health, or dead, and/or with a probable potential for structural failure, are not included in the following analysis and discussion. Public trees are to be replaced at a ratio based on diameter class as set forth in the Tree Preservation and Protection Standards (City of Mississauga 2019); boundary trees will also be replaced at these ratios by virtue of being partly public property. Table 1 outlines the number of trees anticipated to be removed and the resulting minimum number of compensation trees to be planted, based on the preferred Preliminary Design. More trees may be inventoried and accounted for at the Detailed Design stage, which would require an update to the tree compensation requirements.

Table 1: Summary of Trees to be Removed and Recommended Compensation Plan

Tree Inventory	**Total**
Total number of trees inventoried	983
Total number of inventoried trees to be removed	658
Tree Compensation	
Number of trees exempted by poor to very poor health or dead, and/or a probable potential for structural failure	84
Number of trees subject to compensation	**574**
Number of trees to be compensated for at 1:1	213
Number of trees to be compensated for at 2:1	303
Number of trees to be compensated for at 3:1	35
Number of trees to be compensated for at 4:1	12
Number of trees to be compensated for at 5:1	9
Number of trees to be compensated for at 6:1	2
Total compensation plantings	**1,029**

Compensation trees are to be a minimum 60mm caliper stock for deciduous trees or 1.8m tall for coniferous trees, unless otherwise approved by the City (City of Mississauga 2020). Where

compensation for healthy trees is required, planting shall occur as part of a Landscape Plan developed for the reconstructed ROW. According to the Private Tree Protection By-law, where replacement trees are a condition of a permit and not all of the replacement trees are planted on the owner's lot, cash-in-lieu payment may be made to the City's Replacement Tree Planting Fund. A Landscape Plan will be required during Detailed Design to develop a compensation strategy in conjunction with other landscape considerations. General recommendations to be incorporated into a planting plan are provided in Section 6.3.

In addition to City requirements, Credit Valley Conservation and Conservation Halton also have their own guidelines and requirements for the compensation of tree removals within their respective jurisdictions. For example, tree compensation requirements within CVC's regulatory area are determined by identifying appropriate offsetting ratios derived from the basal area of impacted wooded features. For sparsely wooded features or wooded feature edges, ratios are determined based on counts of trees (derived from an inventory of all trees ≥5cm DBH) that fall within defined tree size classes (CVC 2020). Tree compensation within Conservation Halton's regulatory area is based on a 3:1 ratio, whereby three trees are required for each one removed (Conservation Halton 2021). For each of the CVC and Conservation Halton regulated areas, the greater of the conservation authority vs City guideline-based tree compensation requirements will apply. As part of the supplementary tree inventory to be completed during the Detailed Design stage, as described above, additional trees down to 5cm DBH (from the minimum 10m DBH undertaken through this inventory) may need to be inventoried if necessary to calculate CVC tree compensation requirements.

6.0 Tree Protection Measures and Recommended Mitigation

Throughout all stages of development, all effort should be made to retain, and protect the health and root systems of trees that are marked for retention in this TPP. The City or their designate (e.g. construction inspector or site manager) should ensure that all employees and contractors are informed of the meaning and importance of tree protection measures and the ways in which trees to be retained are identified.

6.1 Prior to Construction

Tree Protection Fencing (TPF), or "hoarding" will be installed along the limit of disturbance in order to prevent detrimental impacts to trees from construction activities. The City's Detail: 02830-6 in the Tree Preservation and Protection Standards (2019) states that TPF should, at a minimum, be installed at the dripline of trees being protected. The same document outlines minimum tree protection zones (TPZ) based on the diameter of the tree and whether that tree is within an Open Space or Woodland. Minimum TPZ are shown on Map 1 and Appendix I.

The proposed positions of TPF will afford the greatest protection possible within the proposed grading and reconstruction plan. Where trees are to be retained but where it is not feasible to afford the full extent of the City's recommended setback, it is with the intent of retaining as many trees as possible, and anticipating that the affected trees will tolerate the proposed impacts. This includes areas where some amount of fill may be deposited within a part of trees' root zones.

The current recommended positions of TPF are shown on Map 2; these will be refined at the Detailed Design stage. The TPF is to be installed prior to any construction activities and is to be maintained by the City or their agents. The TPF shall be one of the forms in Detail: 02830-6 (City of Mississauga 2019). Because of the size of the project area, it is recommended that it take the form of 1200mm high heavy-duty orange snow fence secured to steel t-bar stakes with wire ties; the stakes will be fortified with top and bottom rails of wooden 2"x4", as per the detail drawing. The TPF is to include woven geotextile fabric for sediment control.

Where tree removals take place very near a tree to be retained, the stump of the removed tree should be left in-situ and not pulled or ground, in order not to disrupt/damage the root zone(s) of retained trees and other vegetation. Necessary precautions should be taken not to damage retained trees in any way.

Signage measuring 16” x 24” is to be attached to the TPF in every discrete location and indicate the purpose of the protection fencing and prohibited activities within the TPZ. The following activities are prohibited within the TPZ unless otherwise authorized by the City’s Forestry staff: construction activities, storage of materials or equipment, excavation, grade changes, damage to tree parts, vehicle/machine traffic or refueling, dumping, stringing cables or wires. Fencing locations and the City’s signage template are shown on Map 2.

6.1.1 Migratory Birds Convention Act

The removal of trees within the study area has the potential to disrupt nesting birds. The federal *Migratory Birds Convention Act* (MBCA, 1994) identifies a list of migratory bird species that are protected. It prohibits the destruction of nests, individuals and activities that would cause an adult bird to abandon a nest. Tree removal is to occur outside of the core nesting period for migratory birds as established by the Canadian Wildlife Service (CWS 2012) which extends from approximately April 1 through August 31. Every developer/consultant/contractor, etc. is legally obliged to carry out due diligence to protect migratory birds from harm during all construction projects.

6.2 During Construction

The TPF is to be maintained by the City or their agents during the entire construction period to ensure that trees being retained and their root systems are protected. Any minimal damage (i.e. damage to limbs or roots) to trees to be retained during construction must be pruned using proper arboricultural techniques.

In an effort to maximize tree retention in the study area, some trees are recommended to be retained despite an overlap of their crown radius (as a proxy for critical root zone) with proposed grading/works. Most of these incursions will be from grading fill, rather than excavations. While added fill can detrimentally impact root function, retained trees are expected to withstand this impact by virtue of the proportion of root zone impacted and the depth of fill. Root pruning, where necessary, should be performed in accordance with Part 8: Root Management Standard of ANSI A300 and cut roots should be quickly covered with topsoil, burlap or other suitable material and kept moist until covered by soil at final grade.

Should any trees identified to be retained in this report be seriously damaged or die as a result of construction activities, the City will be consulted and presented with a proposed plan of action, such as treatment or replacement. Any replacement species are to be reviewed by a

member in good standing with the Ontario Association of Landscape Architects (OALA) or Certified Arborist.

6.3 Post-Construction

To ensure that fencing is not abandoned to degrade into the environment over time, the TPF is to be removed upon completion of construction activities and stabilization of the site. The City of Mississauga must inspect all TPF prior to removal from the site (City of Mississauga 2019). Watering and pruning of newly planted trees will be carried out by the City or their agents as required during the warranty period (2 years). Any areas of bare soil within the construction area are to be re-vegetated (e.g., sod in urban areas, or otherwise application of a suitable native herbaceous seed mix or nurse crop) as soon as feasible to prevent erosion of soils and keep dust to a minimum.

Where possible, species used for compensation plantings should be native to Peel Region and not include any species that are listed as introduced. The use of hardy species will ensure successful early establishment and minimize the potential for invasive species proliferation. For street tree plantings, the use of non-native species that are sometimes more tolerant of urban conditions (i.e. salt and drought tolerant) may be suitable.

At the Detailed Design stage, it is recommended that the following criteria be followed during the development of proposed planting plans:

- Tree species to be situated in close proximity to roads should be salt tolerant;
- Avoid ash (*Fraxinus* spp.) species due to the risk posed by Emerald Ash Borer (*Agrilus planipennis*);
- All plant material is to conform to the latest edition of the *Canadian Nursery Trades Association Specifications and Standards*;
- Compensation trees will be 60mm DBH for deciduous trees and 1.8m tall for coniferous trees (City of Mississauga 2019);
- Plantings installed as per specifications outlined in planting plans to be prepared by a member in good standing of the OALA or Certified Arborist;
- Spacing of plant material should account for the ultimate size and form of the selected species and also the purpose of the planting, whether it be for screening, shade, naturalizing, rehabilitation, etc.;

- Special attention to location and height of trees in proximity to existing and proposed utilities; and
- Ensure that there is sufficient soil volume for all plantings.

7.0 Conclusion and Next Steps

NRSI was retained by HDR Inc. on behalf of the City of Mississauga to complete a tree inventory and Tree Preservation Plan (TPP) for the proposed reconstruction of Ninth Line in Mississauga, Ontario, as part of a Municipal Class Environmental Assessment (EA). The study area is composed of the ROW from Eglinton Avenue West to Derry Road West. Certified Arborists completed the tree inventory in spring of 2020, gathering detailed information about 983 trees ≥10cm DBH within and adjacent to the ROW.

Of the 983 trees inventoried, 651 trees are anticipated to be removed based on the extent of the proposed construction and site grading. It is recommended that efforts be made to retain seven large stature trees (#756. 757, 758, 759, 809, 836, 837) during the Detailed Design stage by avoiding significant impacts to these trees and their root zones.

In accordance with City of Mississauga policies, 1,029 replacement trees will be needed to compensate for the removal of trees from the project area. Tree removals should take place between October to March in order to avoid the active periods of SAR bats and nesting birds. Before tree removals take place and construction work begins, trees to be retained shall be protected with TPF.

The preferred Preliminary Design may impact more trees than those accounted for in the inventory because the design proposes widening the ROW and site grading beyond the existing ROW. It is recommended that supplementary tree inventory take place in support of the Detailed Design in order to fully assess impacts to trees in the study area, and to update tree compensation requirements accordingly.

Tree Health and Potential for Structural Failure Assessment Criteria

Tree Health Assessment Criteria

Assessment Criteria	Definition[1]
Excellent	Represents a tree in near perfect form, health, and vigour. This tree would exhibit no deadwood, no decline, and no visible defects.
Good	Represents a tree ranging from a generally healthy tree to a near perfect tree in terms of health, vigour and structure. This tree exhibits a complete, balanced crown structure with little to no deadwood and minimal defects as well as a properly formed root flare.
Fair	Represents a tree with minor health, balance or structural issues with minimal to moderate deadwood. Branching structure shows signs of included bark or minor rot within the branch connections or trunk wood. The root flare shows minimal signs of mechanical injury, decay, poor callusing, or girdling roots. Trees in the category require minor remedial actions to improve the vigour and structure of the tree.
Poor	Represents a tree that exhibits a poor vigour, reduced crown size (<30% of crown typical of species caused by overcrowding or decline), extreme crown imbalance, or extensive rot in the branching and trunk wood. Fungus could be seen from these rotting areas, suggesting further decay. These trees have extensive crown die back with a large amount of deadwood, and possibly dead sections. These weakened areas can lead to a potential failure of tree sections. Rooting zones show signs of extensive root decay or damage (fruiting bodies or mechanical damage) or girdling roots. Trees in this category require more extensive actions to prevent failure. A tree identified as poor would be a candidate for removal in the near future.
Very Poor	Represents a tree that exhibits major health and structural defects. Quite often the defects or diseases affecting this tree will be fatal. Large quantities of fungus, large dead sections with possible cavities and bark falling off all are signs that a tree is in a major state of decline and would be identified as very poor. These trees have a probable or imminent potential for structural failure. These trees should be identified for removal.
Dead	Represents a tree that exhibits no sign of new growth, including buds, foliage, or shoot growth. These trees have a probable or imminent potential for structural failure. These trees should be identified for removal.

Potential for Structural Failure Assessment Criteria

Assessment Criteria*	Definition[1]
Improbable	The tree or branch is not likely to fail during normal weather conditions and may not fail in many severe weather conditions within the specified time frame.
Possible	Failure could occur, but it is unlikely during normal weather conditions within the specified time frame.
Probable	Failure may be expected under normal weather conditions within the specified time frame.
Imminent	Failure has started or is most likely to occur in the near future, even if there is no significant wind or increased load. This is a rare occurrence for an assessor to encounter, and it may require immediate action to protect people from harm.
*A specified time frame of 1 year will be used when assessing potential for structural failure.

Conditions of Assessment

Conditions of Tree Assessment

Limitations

This tree inventory and assessment is based on the circumstances and observations by Natural Resource Solutions Inc. (NRSI) as they existed at the time of the site inspection(s) of the study area as described in this report (the “Property”) and the trees situated thereon, and upon information provided by the Client to NRSI. The opinions in this assessment are given based on observations made and using generally accepted professional judgment, however, because trees are living organisms and subject to change, damage and disease, the results, observations, recommendations, and analysis as set out in this assessment are valid only at the date any such observations and analysis took place. No guarantee, warranty, representation or opinion is offered or made by NRSI as to the length of the validity of the results, observations, recommendations and analysis contained within this assessment. As a result, the Client shall not rely upon this assessment, save and except for representing the circumstances and observations at the date of site inspection(s), and the analysis and recommendations made in relation to the proposed undertaking. It is recommended that the inventoried trees discussed in this assessment should be re-assessed periodically, where required (i.e. after 2 years).

Further Services

Neither NRSI, nor any assessor employed or retained by NRSI (the "Assessor") for the purpose of preparing or assisting in the preparation of this assessment shall be required to provide any further consultation or services to the Client including, without limitation, acting as an expert witness or witness in any court in any jurisdiction unless the Client has first made specific arrangements with respect to such further services, including providing payment of the Assessor’s regular hourly billing fees.

NRSI accepts no responsibility for the implementation of all or any part of this report, unless specifically requested to examine the implementation of such activities recommended herein. Any request for the inspection or supervision of all or part of the implementation shall be made in writing and the details agreed to in writing by both parties.

Assumptions

The Client is hereby notified that where any of the information set out and referenced in this assessment are based on assumptions, facts or information provided to NRSI, NRSI will in no way be responsible for the veracity or accuracy of any such information. Further, the Client acknowledges and agrees that NRSI has, for the purposes of preparing their assessment, assumed that the Property is in full compliance with all applicable federal, provincial, municipal and local statutes, regulations, by-laws, guidelines and other related laws. NRSI explicitly denies any legal liability for any and all issues with respect to non-compliance with any of the above-referenced statutes, regulations, by-laws, guidelines and laws as it may pertain to or affect the Property.

Restriction of Assessment

The assessment carried out was restricted to the areas as described in this report. NRSI is not legally liable for any other trees except those expressly discussed herein. The conclusions of this assessment do not apply to any areas, trees, or any other property not covered or referenced in this assessment.

Professional Responsibility

In carrying out this assessment, NRSI and any Assessor appointed for and on behalf of NRSI to perform and carry out the assessment has exercised a reasonable standard of care, skill and diligence. The assessment has been made using accepted arboricultural techniques. These include a visual examination of each tree for structural defects, scars, external indications of decay such as fungal fruiting bodies, evidence of insect attack, discolored foliage (during the leaf-on period), the condition of any visible root structures, the degree and direction of lean (if any), the general condition of the tree(s) and the surrounding site, and the current or planned proximity of property and people. Except where specifically noted in the assessment, none of the trees examined on the property were dissected, cored, probed, or climbed, and detailed root crown examinations involving excavation were not undertaken.

No guarantees are offered, or implied, that trees recommended for retention, or all parts of them, will remain standing. It is professionally impossible to predict with absolute certainty the behaviour of any single tree or group of trees, or all their component parts, in all given circumstances. Inevitably, a standing tree will always pose some risk. Most

trees have the potential to fall, lean, or otherwise pose a danger to property and persons in the event of extreme weather conditions, and this risk can only be eliminated if the tree is removed.

Without limiting the foregoing, no liability is assumed by NRSI or its directors, officers, employers, contractors, agents or Assessors for:

a) any legal description provided with respect to the Property;
b) issues of title and/or ownership with respect to the Property;
c) the accuracy of the Property line locations or boundaries with respect to the Property; and
d) the accuracy of any other information provided to NRSI by the Client or third parties;
e) any consequential loss, injury or damages suffered by the Client or any third parties, including but not limited to replacement costs, loss of use, earnings and business interruption; and
f) the unauthorized distribution of the assessment.

Third Party Liability

This assessment was prepared by NRSI for the Client. The data collected reflect NRSI's best assessment of the inventoried trees situated on the Property with the information available at the time of observation. Data analysis and the assessment of potential impacts to inventoried trees is specific to the proposed undertaking as described in this report. NRSI accepts no responsibility for any damages or loss suffered by any third party or by the Client as a result of decisions made or actions based upon the use of this assessment for purposes unrelated to the proposed undertaking.

General

Any plans and/or illustrations in this assessment are included only to help the Client visualize the issues in this assessment and shall not be relied upon for any other purpose.

This report shall be considered as a whole, no sections are severable, and the assessment shall be considered incomplete if any pages are missing.
