Memos\7359-mv-PM PK Future Sq One- Memo - 09-08-2009.doc

**SUBJECT:** Afternoon peak hour traffic analysis for City Centre Mississauga BRT

#### **Background:**

The City of Mississauga, in conjunction with the Province of Ontario and Government of Canada, is preparing for the construction of the Mississauga Bus Rapid Transit (BRT) Project. The proposed BRT facility will extend from Winston Churchill Boulevard in the west to Renforth Drive in the east, running parallel to Highway 403, Eastgate Parkway and Eglinton Avenue. Through the Mississauga City Centre, the proposed BRT facility will include a median dedicated bus right-of-way on Rathburn Road between approximately Duke of York Boulevard and Shipp Drive.

MRC previously conducted a Traffic Impact Analysis to assess the potential impact of the BRT operation to traffic conditions on Rathburn Road for the morning peak hour. It is noted that the traffic volumes along Rathburn Road with the proposed BRT network and assumed diversion are higher in the morning peak hour and thus presented the worst case analysis in assessing the 2 GPL + BRT concept operations.

The existing signalized intersection at Hammerson Drive (Square One north entrance) and Rathburn Road was proposed in the preliminary design to be converted to a right-in-right-out intersection (RIRO). This design has conflict with Stakeholder's development interest; therefore a traffic analysis was requested in order to assess the impact the signalized intersection would have on BRT operations.

At Square One-Mississauga City Centre, two major developments were recently proposed in the vicinity of the Hammerson Drive/Rathburn Road intersection (the received details are presented in Appendix A). These developments include:

- Whole-foods Grocery Store (40,000 sq.ft)
- Crate & Barrel (24,128 sq.ft)

To measure the impact of the proposed development and associated in-bound traffic destined to the retail market from the signalised intersection at Hammerson Drive/Rathburn Road, a p.m. peak hour analysis was undertaken to reflect the afternoon retail and commuter trips.

This memorandum documents the traffic analysis undertaken to assess the potential impact to traffic operations that may arise from BRT facility in the City Centre with the proposed development and intersection design at City Centre during p.m. peak hour. This memorandum also presents results for the sensitivity analysis for BRT operations with the signalized intersection vs. right-in-right-out intersection at Hammerson Drive/Rathburn Road.

### 1. Analysis Introduction

This study makes use of the VISSIM micro-simulation software for various scenarios relating to the proposed BRT route through the City Centre. The following lists the p.m. peak hour scenarios that were analyzed using the VISSIM model:

Scenario 1: Existing Traffic Conditions (2008 Volume) on existing road network

Scenario 2: Opening day traffic analysis (Existing Traffic+ Site Traffic) on existing road network (overview analysis only)

Scenario 3: Existing traffic volume (2008) on Proposed BRT Network

Scenario 4: Background traffic conditions (Existing traffic + 30% growth) on existing road network.

Scenario 5: Background traffic scenario - (Existing traffic + 30% growth) on BRT network. This scenario involves a sensitivity analysis relating to two different intersection configurations at Hammerson Drive and Rathburn Road.

- 5.1 Signalized Intersection at Hammerson Drive and Rathburn Road
- 5.2 –Right-in-right–out (un-signalized) intersection at Hammerson Drive (Square One North Entrance) and Rathburn Road.

Scenario 6: Total traffic scenario (Background +Site Traffic -Whole Foods Market, Crate and Barrel) on BRT network. This scenario involves an analysis relating to two different intersection configurations at Hammerson Drive and Rathburn Road.

• 6.1 – Signalized T-Intersection, this includes sensitivity analysis with:

A: 300 vehicles on westbound left turn on Rathburn Road to Hammerson Drive.

B: 350 vehicles on westbound left turn on Rathburn Road to Hammerson Drive.

• 6.2 - Four-leg signalized intersection at Rathburn Road and Hammerson Drive

The projected 30% growth represents a 2% growth per annum over a fifteen year period. This memorandum gives a detailed description of each of the scenarios including volume assumptions and calculations, levels of service for intersections and BRT travel times for the future scenarios.

#### 2. PM Peak Hour Analysis

Scenario 1: Existing Traffic Conditions (2008 Traffic Volume on Existing Road Network)

**Road Network:** The existing road network at City Center was coded into the VISSIM model.

## **Traffic Volume Balancing:**

The existing traffic counts reflect the weekday traffic counts undertaken by the City of Mississauga during 2007 and 2008. These traffic counts were balanced using the 2008 traffic counts as the control point. The balanced volumes can be found in Appendix B. The intersections included for the analysis are:

- Station Gate Road with Centre View Drive,
- Station Gate Road with Rathburn Road,
- Hammerson Drive with Rathburn Road,
- City Centre/Centre View Drive with Rathburn Road.

**Transit Network:** The 2008 bus operations were coded into the VISSIM model.

**Signal Timings:** The existing pm peak hour signal timing plans were used for the traffic analysis.

**Results:** The intersection Levels of Service (LOS) and Delay for the existing operational analysis are presented in Table 1. Only four of the intersections are included as they are most relevant to the area of study.

Table 1: Intersection Capacity Analysis Results – Existing Traffic on Existing Network

	In	itersection	Critical Movement					
	LOS	Delay (Sec)	LOS	Queue Length 95%	Movement			
Rathburn and Station Gate	В	10.05	Α	30	EBT			
Rathburn and Hammerson Dr	В	11.88	В	15	WBL			
Rathburn and City Centre	Е	59.12	В	56	WBT			
Centre View and Station Gate	В	13.44	Α	13	WBT			

The results show that the Rathburn Road and City Centre Drive intersection is operating at a saturated Level of Service 'E'. The other three intersections are operating at an acceptable level of service, and with relatively small queue lengths. The results of the intersection operational analysis for this scenario are presented in Appendix C.

Memo To:

Date: October 26, 2009 Page 4

# Scenario 2: Opening day Traffic Conditions on Existing Road Network

### **Traffic Volume Balancing:**

As per information received, Crate & Barrel is proposed to open before commencement of the BRT operation.

The p.m. peak hour trip generation for Crate & Barrel was estimated using rates outlined for a Furniture Showroom in the *ITE Trip Generation* guide. We note that for the p.m. peak hour, the trip generation rate is 0.53 trips / 1000 sq.ft. Crate & Barrel is proposed to be 24,128 sq.ft. – which results in 12.78 trips. With a rate of 50% entrance and 50% exit, there will only be six to seven vehicles added to those entering/existing the Square One area. With two entrances and exits in the vicinity, the generated traffic will not adversely affect the traffic operations at Square One-City Centre.

Therefore, it was not necessary to use a VISSIM model to analyse this operational scenario.

### Scenario 3: Existing Traffic on Proposed BRT Network

The third analysis consisted of 2008 traffic volume on the proposed BRT network.

#### **Road Network:**

As per the preliminary design for the BRT facility, Rathburn Road was proposed to be reduced to 1 lane for the general traffic between Duke of York Boulevard and Hurontario Road. The proposed BRT facility in the Mississauga City Centre is shown in Appendix D. It should be noted that for this scenario, the intersection at Hammerson Drive (Square-One north entrance) /Rathburn Road is analyzed with a signalized intersection instead of a right-in-right-out as identified in the Preliminary Design.

The Preliminary Design indicated that Station Gate Road be turned into an exclusive bus only area, and the ramp from Hurontario Street to the intersection at Centre View Drive and Rathburn Road be altered so the ramp turned north onto Centre View and only allowed vehicles to travel in that direction. The coded network in VISSIM for the proposed BRT facility is presented in Figure 1.

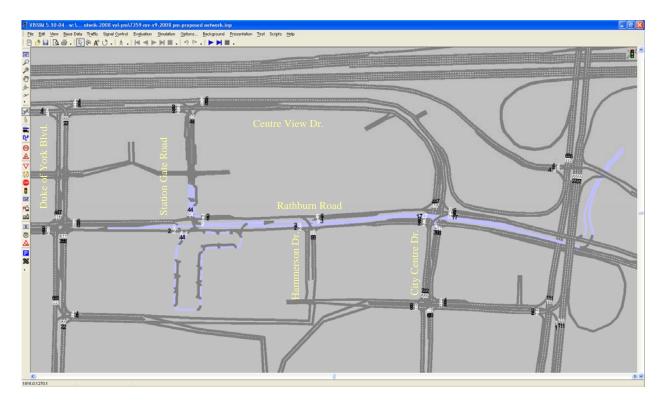

Figure 1: Proposed BRT Network coded in VISSIM

Memo To:

Date: October 26, 2009 Page 6

### **Traffic Volume Balancing:**

To assess the impact of the traffic diversion to alternative routes due to the BRT network, further intersections were added for the analysis. These intersections include:

- Rathburn Road and Duke of York Boulevard,
- City Centre Drive and the East entrance of Square One Drive,
- Centre View Drive and Duke of York Boulevard,
- Duke of York Boulevard and the West entrance of Square-One Drive.

The volumes at these intersections were then balanced to match with the previous balanced traffic flows. The adjusted 2008 traffic volume with BRT road network is presented in Appendix B.

The majority of the through traffic and all of the right turning traffic initially coming from the Hurontario Street off-ramp was assigned to travel north-west along Centre View Drive.

A portion of the through traffic originally coming from Hurontario Street was determined to be turning left onto Hammerson Drive off of Rathburn. This traffic was reassigned along with the Hurontario ramp left turning traffic to travel south down Hurontario Street. Then this volume was diverted westbound onto Square One Drive. The traffic was then split between left turn and through movements at WB Square One Drive E. and City Centre Drive.

Since BRT lanes are provided along Rathburn Road, all vehicle traffic assigned to Station Gate Road were diverted. The right and left turns from Rathburn Road onto Station Gate Road and from Station Gate Road onto Rathburn Road were revised to right and left turns onto and out of Duke of York Boulevard. Similarly, the right and left turns from Centre View Drive onto Station Gate Road and from Station Gate Road onto Centre View Drive were revised to right and left turns onto and out of Duke of York Boulevard at Centre View Drive.

**Transit Network:** The existing 2008 bus operations were coded into the VISSIM model.

**Signal Timings:** Volumes were inputted into a Synchro model of the City Centre area and signal timings were optimized with the effect of the proposed BRT network.

**Results:** The results were simulated using VISSIM. The intersection Levels of Service (LOS) and Delay are presented in Table 2. The LOS and Queue Lengths for the critical movements at each intersection are also included.

The results of the intersection analysis for this scenario are presented in the Appendix C – Analysis Results.

Table 2: Intersection Capacity Analysis Results - Existing Traffic on BRT Network

	Ir	itersection	Critical Movement				
	LOS	Delay (Sec)	LOS	Queue Length 95%	Movement		
Rathburn and DOY Blvd	С	24.81	С	39	NBL		
Rathburn and Station Gate	В	10.65	В	54	EBT		
Rathburn and Hammerson Dr	В	14.99	В	10	WBL		
Rathburn and City Centre	С	25.71	В	106	WBT		
City Centre and Square One East	В	16.64	В	47	NBT		
Centre View and Station Gate	Α	0.34	Α	0	WBT		
Centre View and DOY Blvd	Α	9.44	В	42	NBL		

Changing the configuration of the Rathburn Road and City Centre Drive intersection positively affects the performance of the intersection with less average delay with the Level of Service improving to 'C' from the existing Level of Service 'E'. This is due to the removal of one phase in the cycle which frees up time for all the other movements.

Although the queue length for the westbound through movement increases, this increase can be attributed to the fact that the receiving lanes on the other side shrink from two to one thereby reducing the capacity of the through movement. All other intersections operate at acceptable levels with minimal queues and without significant change in average delay.

Memo To:

Date: October 26, 2009 Page 8

#### Scenario 4: Background Traffic Conditions on Existing Road Network

**Road Network:** The existing road network was used for this Scenario.

### **Traffic Volume Balancing:**

The balanced traffic from Scenario 1 was increased by 30% for the future traffic growth to obtain the background traffic.

**Transit Network:** The existing bus operations were coded into the VISSIM model as the BRT network and BRT transit service are not operational.

**Signal Timings:** The existing p.m. peak hour signal timing plans were used for the traffic analysis.

**Results:** The intersection Levels of Service (LOS) and Delay for the future operational analysis are presented in Table 3. Only four of the intersections are included as they are most relevant to the area of study.

Table 3: Intersection Capacity Analysis Results – Future Traffic on Existing Road Network

	In	tersection	Critical Movement			
	LOS	Delay (Sec)	LOS	Queue Length 95%	Movement	
Rathburn and Station Gate	В	11.2	В	38	EBT	
Rathburn and Hammerson Dr	В	12.73	В	17	WBL	
Rathburn and City Centre	F	85.74	С	234	WBT	
Centre View and Station Gate	В	13.39	Α	14	WBT	

The results indicate a "Do-Nothing Scenario" at the Rathburn Road and City Centre Drive intersection will degrade the level of service from 'E' to 'F'. The queue lengths and average delay will also increase significantly at this intersection.

The other three intersections will still operate at acceptable levels of service, have roughly the same delays and have relatively small queue lengths at the critical movements. The results of the future operational analysis are presented in Appendix C.

# Scenario 5: Background Traffic Conditions on Proposed BRT Network

#### **Road Network:**

For Scenario 5, two sub-scenarios were analysed.

# Scenario 5.1: T-intersection (signalized) at Hammerson Drive and Rathburn Road

This scenario used the same road network as Scenario 3.

# Scenario 5.2: RIRO (un-signalized) at Hammerson Drive and Rathburn Road

In this scenario, the signalized t-intersection at Hammerson Drive (Square One North Entrance) and Rathburn Road was converted into a right-in-right-out intersection. Therefore, the in-bound and out-bound left turning movements from Hammerson Drive were banned with a right-in-right-out (RIRO) as per preliminary design.

Figure 2 shows a VISSIM representation of this intersection.

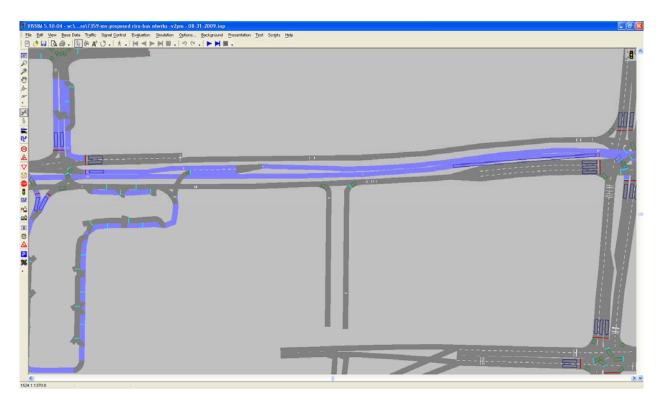

Figure 2: RIRO Intersection at Rathburn Road and Hammerson Drive

Memo To:

Date: October 26, 2009 Page 10

### **Traffic Volume Balancing:**

Traffic Volume Balancing for Scenario 5.1:

To estimate background traffic, the traffic volume for Scenario 3 was used and an additional 30% additional traffic was added to each movement. The WB left turning movement at Rathburn Road and City Centre Drive was reduced to 350 vehicles from 446 as experience suggest to be the maximum volume that a single left turn lane could provide before significant delay results (Highway Capacity Manual 2000 suggests Double exclusive left turns for traffic volume greater than 300). This adjustment provided the balanced volume distribution for the future scenario with a signalized Hammerson Drive and Rathburn Road intersection.

Traffic Volume Balancing for Scenario 5.2:

The northbound left turning movement out of Hammerson Drive was redistributed to a right turning movement at Square One Drive West with Duke of York Boulevard. This additional volume was then split proportionally between northbound through and left turning movements at the Duke of York Boulevard/Rathburn Road intersection. The split was proportional to westbound through and right turning traffic at the same intersection.

For the future analysis, the 200 vehicles forecast to be turning left from Rathburn Road to Hammerson Drive were reassigned. Due to limited capacity at Rathburn Road and City Centre Drive, the 50 of the vehicles were assigned to the westbound left turning movement at the intersection of City Centre Drive and Rathburn Road. The other 150 vehicles were assumed to turning left at Rathburn Road and Shipp Drive, travelling south to Robert Speck Parkway and then west towards Centre View Drive. The 150 vehicles were then diverted north where the vehicles were assigned to a north bound left turning movement at the intersection of Square One Drive East entrance and City Centre Drive.

**Transit Network:** The a.m. peak hour BRT and local bus operation assumptions were utilised for the p.m. peak hour VISSIM analysis.

**Signal Timings:** Traffic volumes were input into a Synchro model of the City Centre area and signal timings were optimized. For both of the options considered in this scenario, BRT lanes were given an exclusive phase at the end of the signal cycle. The phase for the buses were 18 seconds and buses coded such that they cannot travel through the intersections outside of their exclusive phase.

**Results:** The results were simulated using VISSIM. The intersection Levels of Service (LOS) and Delay for Scenario 5.1 and Scenario 5.2 are presented in Table 4 and Table 5 respectively. The LOS and Queue Lengths for the critical movements at each intersection are also included.

**Table 4: Intersection Capacity Analysis Results for Scenario 5.1** 

Signalized Square One Dr	In	itersection	Critical Movement				
	LOS	Delay (Sec)	LOS	Queue Length 95%	Movement		
Rathburn and DOY Blvd	D	39.79	D	123	NBL		
Rathburn and Station Gate	С	24.83	D	314	EBT		
Rathburn and Hammerson Dr	С	23.01	E	59	WBL		
Rathburn and City Centre	D	54.33	Е	309	WBT		
City Centre and Square One East	Е	58.66	F	107	NBT		
Centre View and Station Gate	Α	2.52	Α	11	WBT		
Centre View and DOY Blvd	В	14.15	В	62	NBL		
Square One West and DOY Blvd	В	17.71	D	51	WBL		

Table 5: Intersection Capacity Analysis Results for Scenario 5.2

RIRO Square One Dr	În	tersection	Critical Movement				
	LOS	Delay (Sec)	LOS	Queue Length 95%	Movement		
Rathburn and DOY Blvd	D	40.21	D	154	NBL		
Rathburn and Station Gate	В	18.04	С	215	EBT		
Rathburn and Hammerson Dr	Α	6.4	N/A	N/A	WBL		
Rathburn and City Centre	D	52.14	Е	270	WBT		
City Centre and Square One East	D	39.01	С	90	NBT		
Centre View and Station Gate	Α	2.07	Α	12	WBT		
Centre View and DOY Blvd	В	13.44	В	52	NBL		
Square One West and DOY Blvd	В	14.76	С	50	WBL		

All the intersections' Levels of Service increase by one grade compared to existing traffic on BRT network, with the exception of City Centre and Square One East which goes from 'B' to 'E' and Centre View and Station Gate which remains at a LOS 'A'.

Changing the Rathburn Road/ Hammerson Drive intersection to an unsignalized RIRO improves the LOS, Delay and Queue Lengths for all intersections except Rathburn Road and Duke of York Boulevard. However, this intersection only experiences a minor degradation in Delay and Queue Lengths, while Levels of Service remain the same.

The comparison of background traffic without the BRT network and with the BRT network is presented in Table 6. The intersection at Rathburn Road/Hammerson Drive is assumed to be a Signalized T-intersection for this comparison.

Table 6: Comparison of Intersection Operation Analysis with and without BRT network

	Without BRT Net	work – Scenario 4	With BRT Network- Scenario			
	LOS	Delay (Sec)	LOS	Delay (Sec)		
Rathburn and Station Gate	В	11.2	С	24.83		
Rathburn and Hammerson Dr	В	12.73	С	23.01		
Rathburn and City Centre	F	85.74	D	54.33		
Centre View and Station Gate	В	13.39	Α	2.52		

Scenario 6: Future Traffic with Additional Volume from Proposed Developments

#### **Road Network:**

For Scenario 6, two sub-scenarios were analysed.

Scenario 6.1 – T-Intersection at Hammerson Drive with Rathburn Road

This scenario used the same base road network as Scenario 3 modified to undertake the following operational sensitivity tests.

- 6.1 A: 300 vehicles on westbound left turn at Rathburn Road/ Hammerson Drive
- 6.1 B: 350 vehicles on westbound left turn at Rathburn Road/ Hammerson Drive
- Scenario 6.2 Four-Leg Intersection at Rathburn Road/ Hammerson Drive

This scenario used the same road network as Scenario 3 with an additional leg northbound at Rathburn Road and Hammerson Drive.

### **Traffic Volume Balancing:**

This scenario dealt with the additional traffic volume that would be produced as a result of the proposed Whole Foods development added to the background traffic growth. For this scenario, MRC conducted a traffic count survey at a 'Whole Foods' market in Oakville to observe traffic entering and exiting the plaza. A memo was created which presented the results of this study called 'Whole Foods – Traffic Counts/Trip Generation Analysis' found in Appendix E.

This memo presents trip rates along with the other findings of the study. To calculate the additional volumes, the trip rates for the road peak hour were used. For vehicles coming into the Whole Foods parking lot, a trip generation rate of 3.29 vehicles/1000 square feet of building space was used. For vehicles exiting the Whole Foods parking lot, a trip generation rate of 2.98 vehicles/1000 square feet was used. For the purposes of this study, we assumed the Whole Foods market to be built at Square One would be approximately the same size as the other Whole Foods market in Oakville.

The Whole Foods Market in Oakville (Cornwall Road and Reynolds St) was measured in Google Earth to be approximately 38,200 square feet. Subsequent to the analysis presented in Appendix E, we have received a plan of the proposed City Centre Whole Foods market which shows it to be 40,000 square feet. Since the difference is minimal, an updated analysis using this number was not completed. Using the same trip generation rates, the estimated vehicle trip attraction was 126 vehicles and the estimated vehicle trip origin was 114 vehicles each hour.

Two analysis Scenarios include:

#### Scenario 6.1 A: 300 vehicles on westbound left turn at Rathburn Road/Hammerson Drive

The first Scenario assumes 100 vehicles added to the WB left turning movement at Rathburn Road and Hammerson Drive (to obtain 300 left turning vehicles) and the other 26 vehicles added to the EB right turning movement. The additional 114 vehicles departing the new development were split proportionally between right and left turns at this intersection.

### Scenario 6.1 B: 350 vehicles on westbound left turn at Rathburn Road/ Hammerson Drive

The second scenario was similar, however instead of 300 left turning vehicles; the volume was increased to 350, the increased left turns provided a sensitivity analysis to account for higher trips and proposed development of 'Crate and Barrel'.

## Scenario 6.2: Four leg intersection at Rathburn Road/ Hammerson Drive

Scenario 6.2 included assessing the Rathburn Road/Hammerson Drive intersection as a four-leg intersection. This intersection design was proposed given the possibility of a new condominium building being built on the north east corner of this area. To successfully complete the analysis, additional volumes were added to the six new movements (EB left, NB through, WB right, SB left, through and right).

It should be noted that vehicles going into the new roadway are much higher then those exiting due to the nature of the analysis, more people will generally be coming home from work then leaving the complex for a work or shopping purpose. The balanced volumes used in these scenarios can be found in Appendix B.

#### **Road Network:**

For Scenario 6.1 A and Scenario 6.1 B, the same road network as Scenario 3 was used.

For Scenario 6.2, the T-intersection at Rathburn Road and Hammerson Drive is converted into a four-leg intersection. An additional leg added north of Rathburn Road will simulate an entranceway to the proposed condominium building. A VISSIM image of this is shown in Figure 3.

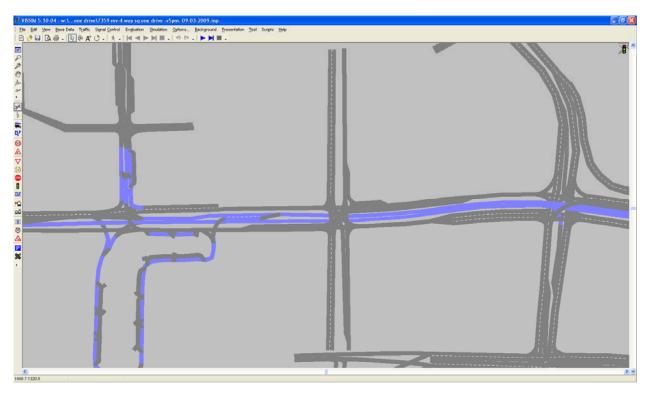

Figure 3: Four Way Intersection at Rathburn Road and Hammerson Drive

**Transit Network:** The future bus operations as used in Scenario 5 was used for the BRT network analysis.

**Signal Timings:** Volumes were input into a Synchro model of the City Centre area and signal timings were optimized. For both of the options in this scenario, BRT lanes were given an exclusive phase at the end of the cycles. Phase times of 18 seconds were assigned to the buses. The buses were restricted from traveling through the intersections outside of their exclusive phase.

**Results:** The results were simulated using VISSIM. The intersection Levels of Service (LOS) and Delay for Scenario 6.1 A and 6.1 B are presented in Table 7 and Table 8. The LOS and Queue Lengths for the critical movements at each intersection are also included.

Table 7: Intersection Capacity Analysis Results for Scenario 6.1 A

300 Left Turns into Square One	In	tersection	Critical Movement				
	LOS	Delay (Sec)	LOS	Queue Length 95%	Movement		
Rathburn and DOY Blvd	D	53.6	D	151	NBL		
Rathburn and Station Gate	С	30.03	Е	335	EBT		
Rathburn and Hammerson Dr	D	37.43	F	180	WBL		
Rathburn and City Centre	F	99.31	F	444	WBT		
City Centre and Square One East	E	61.57	F	105	NBT		
Centre View and Station Gate	Α	2.14	Α	8	WBT		
Centre View and DOY Blvd	В	13.54	В	51	NBL		
Square One West and DOY Blvd	С	25.98	D	60	WBL		

Table 8: Intersection Capacity Analysis Results for Scenario 6.1 B

350 Left Turns Into Square One	In	itersection	Critical Movement				
	LOS	Delay (Sec)	LOS	Queue Length 95%	Movement		
Rathburn and DOY Blvd	Е	61.69	D	187	NBL		
Rathburn and Station Gate	С	34.3	Е	372	EBT		
Rathburn and Hammerson Dr	D	42.9	F	209	WBL		
Rathburn and City Centre	F	102.2	F	445	WBT		
City Centre and Square One East	Е	63.3	F	107	NBT		
Centre View and Station Gate	Α	2.53	Α	13	WBT		
Centre View and DOY Blvd	В	13.59	В	48	NBL		
Square One West and DOY Blvd	С	30.92	D	62	WBL		

Referencing back to the results from Scenario 3, increasing the Rathburn Road WB left turn volume at Hammerson Drive affects the LOS and Queue Lengths of both the Rathburn Road/Hammerson Drive intersection and the Rathburn Road/City Centre Drive intersection. The other intersections experience slight increase in Queue Lengths which correspond to the minimal increase in volume coming through.

Table 9: Intersection Capacity Analysis Results for Scenario 6.2

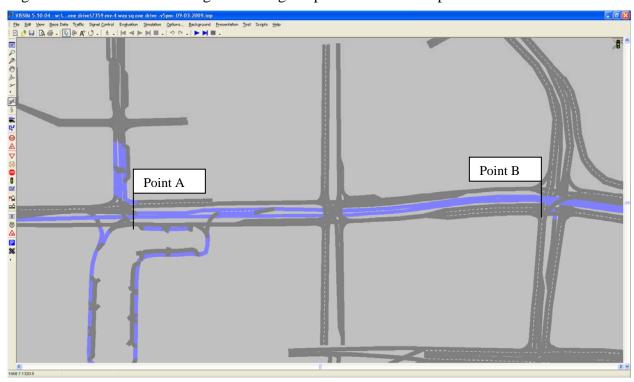

1	În	itersection	Critical Movement					
	LOS	S Delay (Sec) LOS Queue Length 95%		Queue Length 95%	Movement			
Rathburn and DOY Blvd	Е	72.22	Е	159	NBL			
Rathburn and Station Gate	D	35.39	Е	344	EBT			
Rathburn and Hammerson Dr	Е	55.02	F	188	WBL			
Rathburn and City Centre	F	117.66	F	445	WBT			
City Centre and Square One East	Е	71.09	F	146	NBT			
Centre View and Station Gate	Α	2.5	Α	12	WBT			
Centre View and DOY Blvd	C	21.27	В	46	NBL			
Square One West and DOY Blvd	С	29.15	Е	N/A	WBL			

The results for Scenario 6.2, shows a decrease in Queue Length for the WB left turn movement at Rathburn Road and Hammerson Drive from the previous analysis for Scenario 6.1 A. To accommodate the new movement the signal timings were revised.

Although the WB left turn movement reflects a decreased Queue Length, the overall LOS increases to LOS 'E' as the average Delay increased from 43 seconds to 55 seconds. This indicates that any additional developments will results in more delay to the existing intersections. The critical movements at the intersection experienced only minor increases or decreases in Queue Lengths, as these movements were operating in a congested state. The detailed analysis results can be found in Appendix C.

### 3: BRT Travel Times

The BRT bus travel time results from Scenario 5 and Scenario 6 are summarized in Table 10, providing a summary of all BRT bus travel times going between points A and B (EB) and going between points B and A (WB). Point A is located on the Eastern edge of Station Gate Road on Rathburn Road. Point B is located on the Western edge of City Centre Drive on Rathburn Road. Figure 4 shows a VISSIM image indicating the placement of these points.

**Figure 4: BRT Travel Time Point** 

Table 10: Summary of BRT Bus Travel Times between Points A and B (EB) and Points B and A (WB)

	EB	BRT	WB	BRT	Total BRT	Average
Scenario	BRT Bus Volume	Travel Time (Sec)	BRT Bus Volume	Travel Time (Sec)	Bus Volume	Weighted Travel Time (Sec)
Future Volume – Signalized (Scenario 5.1)	48	185	27	204	75	191.84
Future Volume – RIRO (Scenario 5.2)	47	104	29	106	76	104.76
Future With Development (300 LT – Scenario 6.1A)	48	233	27	228	75	231.20
Future With Development (350 LT- Scenario 6.1 B)	49	233	27	242	76	236.20
Future With Development (4 leg Int. – Scenario 6.2)	48	274	28	241	76	261.84

The results of the BRT bus travel time analysis show a steady decrease in travel time as additional development occurs along the roadway with a signalized intersection at Hammerson Drive/Rathburn Road. Scenario 5.1 ('Future Volume – Signalized') represents results from the future volume on the proposed BRT network with a T-Intersection at Hammerson Drive and Rathburn Road. This is the base scenario against which the others are measured.

Table 10 indicates that revising the intersection design at Rathburn Road/Hammerson Drive to an RIRO (right in-right out) will provide less delay to the BRT line. The average travel time is decreased by 87 seconds. This decrease in time results as the buses no longer have to wait for their phase in the cycle to cross through the intersection.

Conversely, adding the additional volume that the Whole Foods Market development will produce increased bus travel time. By adding an additional 100 left turning vehicles into the development, and increasing the vehicles leaving by 114, more time must be allocated to those turning movements resulting in decreased amount of time given to the buses and increasing the average travel time per bus by 39 seconds.

It is also noted that adding 50 additional in-bound left turning vehicles for the proposed development results in bus time increasing by an average time of 44 seconds.

The last scenario involves revising the T-intersection design at Rathburn Road and Hammerson Drive into a four-leg signalized intersection. The four-leg signalized intersection design results in the bus phases receiving a smaller percentage of green time. Thus bus travel times will increase from 192 seconds to 262 seconds. This difference of 70 seconds is very significant in that more then an extra minute is added to the travel time for each bus over a very small distance.

Memo To:

Date: October 26, 2009 Page 18

#### Conclusion:

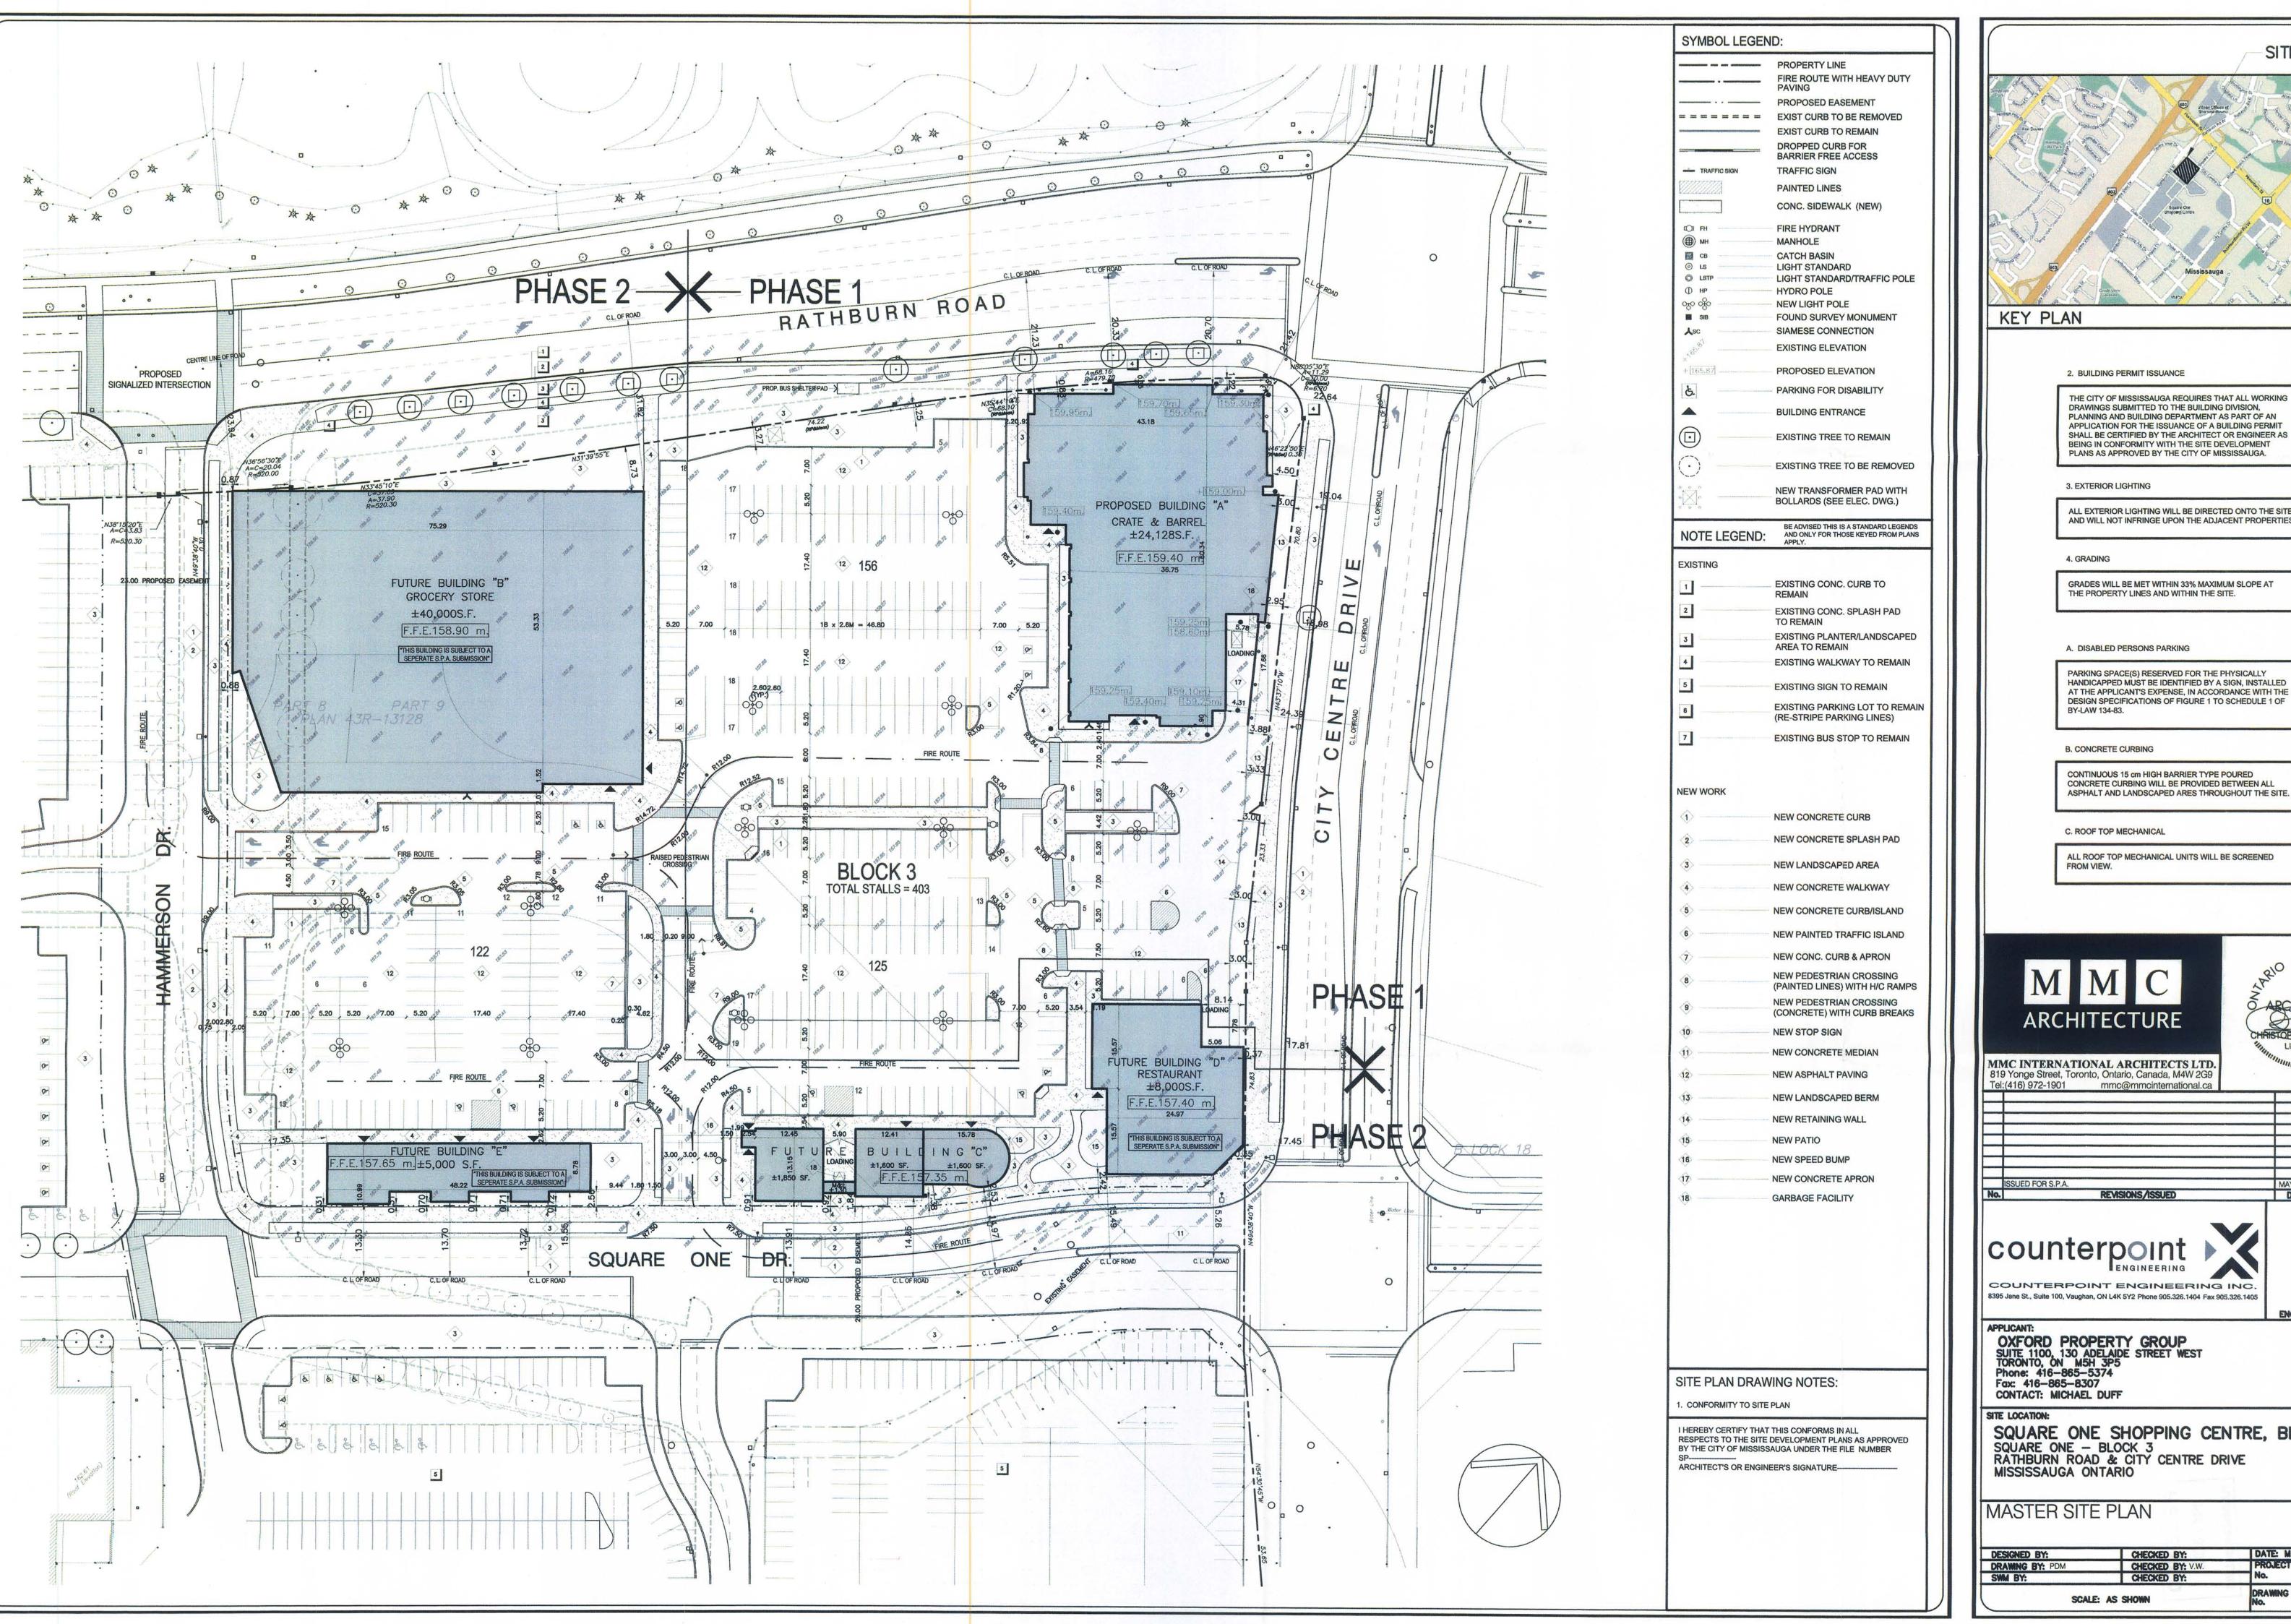

Buses travelling through the study area (Rathburn Road from Station Gate Road to City Centre Drive) will experience increased travel times due to the development of both the Whole Foods Market development and the possible residential development on the north east corner of the intersection. With the Whole Foods Market and Crate and Barrel development, travel times for buses increase on average by 44 seconds per bus. With these two developments, and the possible residential development, bus travel time will increased by 70 seconds per bus.

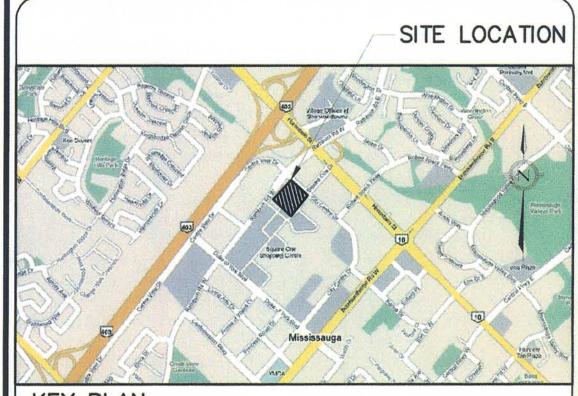

It should be noted that revising the intersection design at Rathburn Road/Hammerson Drive from a T-intersection to an un-signalized RIRO intersection reduces bus travel time by 87 seconds and increases in conjunction with increased development levels.

The intersection analyses' indicate that significant delays are to be expected at the Rathburn Road/City Centre Drive intersection and the Rathburn Road/Hammerson Drive intersection after development of the Whole Foods Market and Crate & Barrel showroom.

With the implementation of the BRT network, the intersection average delay at Rathburn Road/City Centre Drive/Centre View Drive was estimated to be reduced for the existing and background traffic scenarios. Thus, the proposed design would not adversely affect the traffic operational analysis.

# APPENDIX A PROPOSED DEVELOPMENT AT SQUARE ONE

DRAWINGS SUBMITTED TO THE BUILDING DIVISION, PLANNING AND BUILDING DEPARTMENT AS PART OF AN APPLICATION FOR THE ISSUANCE OF A BUILDING PERMIT SHALL BE CERTIFIED BY THE ARCHITECT OR ENGINEER AS BEING IN CONFORMITY WITH THE SITE DEVELOPMENT

ALL EXTERIOR LIGHTING WILL BE DIRECTED ONTO THE SITE AND WILL NOT INFRINGE UPON THE ADJACENT PROPERTIES.

GRADES WILL BE MET WITHIN 33% MAXIMUM SLOPE AT

PARKING SPACE(S) RESERVED FOR THE PHYSICALLY HANDICAPPED MUST BE IDENTIFIED BY A SIGN, INSTALLED AT THE APPLICANT'S EXPENSE, IN ACCORDANCE WITH THE DESIGN SPECIFICATIONS OF FIGURE 1 TO SCHEDULE 1 OF

CONCRETE CURBING WILL BE PROVIDED BETWEEN ALL ASPHALT AND LANDSCAPED ARES THROUGHOUT THE SITE.

ALL ROOF TOP MECHANICAL UNITS WILL BE SCREENED

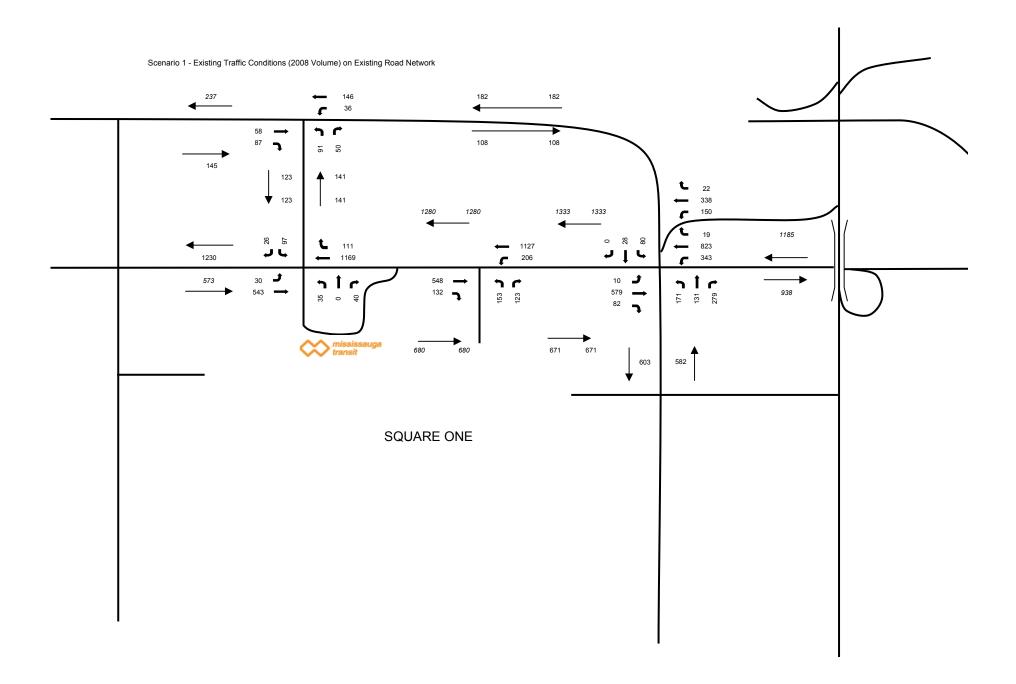

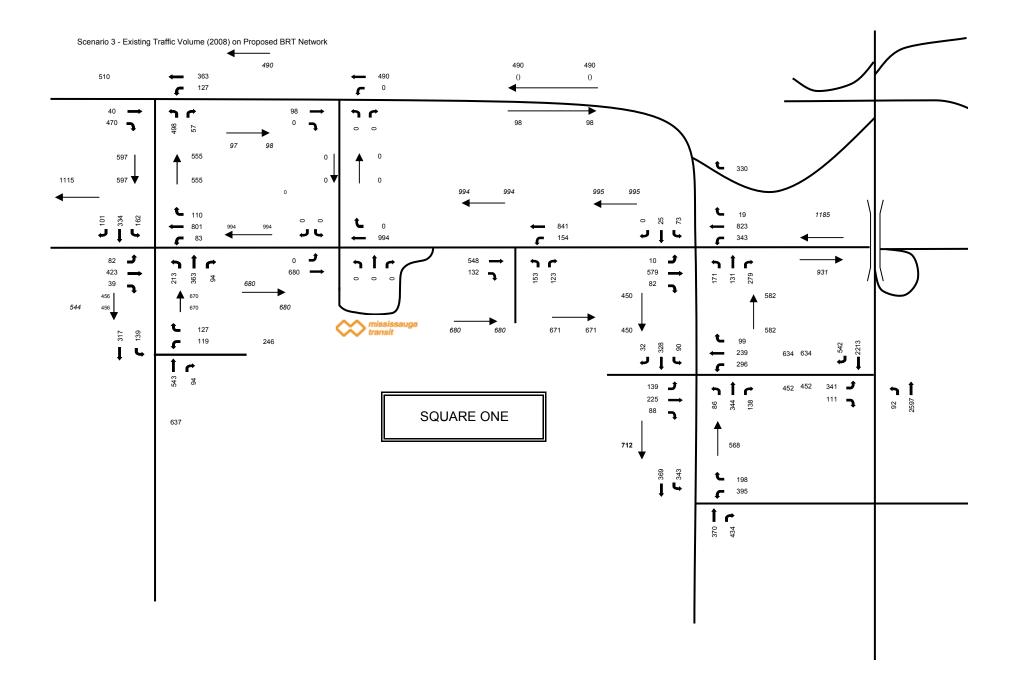

ENGINEER'S STAMP

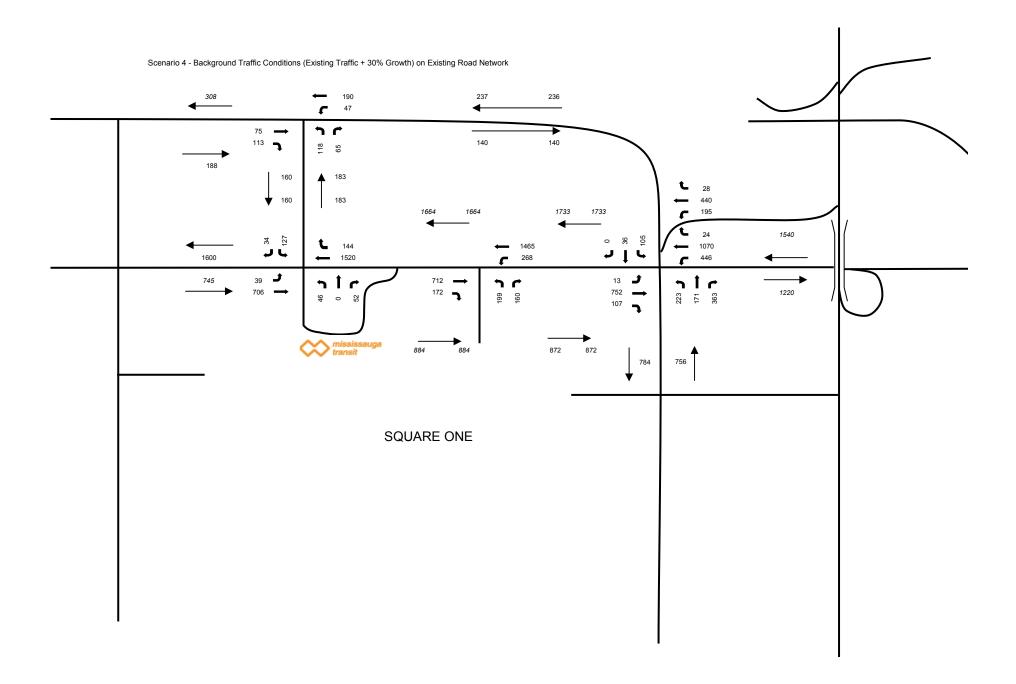

SQUARE ONE SHOPPING CENTRE, BLOCK 3

Count Memo august28.doc

#### Purpose/Location

A traffic count survey was conducted on Thursday, August 13, 2009 to determine the automobile trip generation of the shopping centre east of Trafalgar road on Cornwall Road in Oakville. These counts were undertaken from 7:30 AM to 9:30 AM, from 10:00 AM to 1:00 PM, and from 2:00 PM to 5:30 PM. The temperature was 30°C and the sky was clear. The data that was collected includes all vehicle traffic movements from all directions for three different access points to the shopping centre (refer to Figure 1 on page 2):

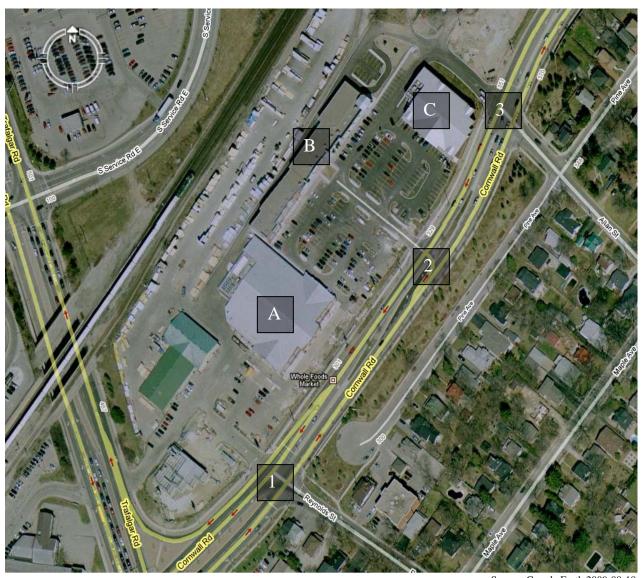

- 1. The intersection of Reynolds Street and Cornwall Road
- 2. The main entrance to the shopping centre from Cornwall Road
- 3. The intersection of Allan Street and Cornwall Road

The Shopping centre has three different retail destinations. It has been assumed that the traffic entering the shopping centre at the three access points are arriving at one of these three retail destinations (refer to Figure 1 on page 2).

- **A.** Supermarket (Whole Foods)
- **B.** Strip Plaza (Includes Starbucks, and Blockbuster)
- C. Drug Store (Shoppers Drug Mart)

The Google Earth image on the following page indicates the locations of the three intersections and the three retail destinations.

Figure 1: Location Map

Source: Google Earth 2009-08-18

#### **Traffic Movements**

The traffic movements illustrated in the following diagrams (Figure 2 – Figure 10) reflect site peak travel characteristics. Note that southbound refers to traffic exiting the shopping centre.

### **Retail Destination Split**

The trip generator totals from figure 14 have been divided amongst the three destinations. Destination split assumptions are based on the size of the relative destination, the location of the access points in relation to the destination, and the trip generation sample averages for the respective land uses as exemplified in the ITE Trip Generation Report. The values in figure 15 show the number of traffic movements that have been allocated to the given destination during a destination peak hour and the PM peak road hour.

Figure 15

# **Trip Generation Rates**

Peak-hour trip generation rates for each of the retail destinations have been calculated and are summarized in the following table (Figure 16). These values are a function of the gross floor area of the retail destination and the traffic movements that have been allocated to that destination.

Figure 16

	Trip	os/1000 Sq.ft. of	floor area - T	wo way	
	Time Period	Whole Foods	Strip Plaza	Pharmacy	Entire Shopping Centre
	Midday Peak Hour	3.85	3.97	4.31	3.99

OUR FILE: W:\7k\7359 City Center BRT Functional Planning\7359.500 Transport\7359.505 Technical

Memos\7359-ks-traffic projections comparisons.doc

**SUBJECT:** Comparisons of Traffic Projections

This memorandum presents comparisons of traffic projections for the future employment and population at City Centre considered by McCormick Rankin Corporation and presented by City of Mississauga.

The City of Mississauga presented 'City Centre Transportation Analysis and Discussion' on August 25, 2009. This presentation presents the existing (2006) and future (2031) employment and population forecast for the City Center. The key details from the presentation are presented below in Table 1.

Table 1 Key Detail from Presentation on 'City Centre Transportation Analysis'

Year/ Description	2006	2031
Population	5,241	21,279
Employment	11,049	16,980
Population to Employment Ratio	0.47	1.25
Transit Mode Split		
- Originating	5 %	27 %
- Destined	10 %	22 %

Based on the information provided, the growth in traffic resulting from population and employment growth are estimated. It is assumed that growth in population will result in increase in out-bound trips and growth in employment will result in additional in-bound trips for the morning peak hours.

Date: September 1, 2009 Page 2

# 1. Anticipated Traffic Growth due to Population:

The number of Dwelling Units	
• For year 2006 (assuming 1.5 population./ Unit):	3,494
• For year 2031 (assuming 1.8 population/ Unit):	11,822
Average Vehicle Trip Rate (ITE) for High- Rise Apartment during morning peak hour:	0.34
Estimated Vehicle Trips:	
• For year 2006:	1,188
• For year 2031:	4,019
As per projection, the transit mode split is expected to increase from 5% to 27%. That will result in 22% less vehicle trips due to transit. That will result in vehicle trips:	3,135
The population to employment ratio is going to grow radically from 0.47 to 1.25 in future that may result in more internal trips to work. These trips may be conducted by walking/ using local roads/ cycle. Considering 13% trips would be local trips, that result in additional future trips due to population in 25 year:	2,775
Considering the same growth, the future trips for next 15 years:	1, 636
Total Growth in Traffic due to population (out-bound) in 15 years: MRC considered out-bound traffic growth (2 % for next 15 year):	138 % 130 %

This represents that MRC estimated traffic growth due to population is almost in the similar range with the growth projected by the City of Mississauga.

Date: September 1, 2009 Page 3

# 2. Anticipated Traffic Growth due to Employment:

<ul> <li>2006 Total Employment:</li> <li>Existing Transit mode share (10% for destined trips):</li> <li>Therefore, Existing Vehicle Trips:</li> </ul>	11,049 1,105 9,944
For year 2031 – Total Employment:  • Future Transit mode share (22% for destined trips):  • Future Vehicle Trips:	16,980 3,736 13,244
Additional Vehicle Trips in 25 years:	2,195
Additional Vehicle Trips in 15 years:	1,317
That results in Total Vehicle Trips (15 years):	12,366
Total Growth in Traffic (in-bound) due to Employment for next 15 years:	112 %
MRC considered (in-bound) Traffic Growth:	130 %

This represents that MRC estimated traffic growth due to employment is more conservative than City of Mississauga projection.

# APPENDIX G SIGNAL TIMING OPTIONS FOR BRT NETWORK

2655 North Sheridan Way Mississauga, Ontario, L5K 2P8 Tel: (905)823-8500

Fax: (905) 823-8503 E-mail: mrc@mrc.ca Website: www.mrc.ca

# **MEMO**

**TO:** File

**FROM:** Keyur Shah

**DATE:** October 27, 2009 **COPIES:** Jack Thompson

OUR FILE: W:\7k\7359 City Center BRT Functional Planning\7359.500 Transport\7359.505 Technical

Memos\PM peak hour analysis\7359-ks-signal timing options-v4.doc

**SUBJECT:** Proposed Signal Timing for BRT at City Centre, Mississauga

During the traffic operational analysis conducted for morning and afternoon peak hours, signal timings at the Rathburn Road with City Centre Drive intersection and Rathburn Road with Hammerson Drive intersection were analyzed using the following criteria:

- Westbound left turns operate with Protected + Permitted phasing,
- BRT lines operate on a dedicated signal phase.

To address additional technical issues with respect to the traffic signal operations for the intersections noted above, a sensitivity analysis was undertaken. The analysis utilized the Synchro software to compute average delays for the Background traffic (Scenario 5.1) at the Rathburn Road and City Centre/Centre View Drive intersection for the afternoon peak hour considering the two signal timing options described below:

Option 1: BRT lines travel on dedicated traffic signal phasing (as assumed in the traffic operational analysis)

- Westbound left turns operate with Protected (Phase 1),+ Permitted (Phase 6) Eastbound left turns with permitted phase (Phase 2);
- BRT lines operate on a dedicated signal phase (Phase 9).

Option 2: BRT lines travel with the through traffic

- Eastbound and Westbound left turns operate with a Protected Phase only (Phase 1 and Phase 5 respectively);
- BRT lines as well as General traffic (eastbound and westbound) operate during the same phases (Phase 2 and Phase 6).

The average delays for the two options are presented below:

Options	Average Intersection Delay
Option 1	54.3 Seconds
Option 2	45.1 Seconds

The Synchro signal timing plans and Synchro Results for average delay for Option 1 and Option 2 are attached.

Memo To: File

Date: October 27, 2009 Page 2

The above results show that the signal timing plan without a dedicated phase for BRT (Option 2) reduced the average delay. Therefore the Background and Total (future) traffic operational analysis with the BRT network may experience a reduction in estimated delay if the signal timings used in Option 2 are considered. This signal timing option would be used for the Rathburn Road/ City Centre/Centre View Drive intersection and for the Rathburn Road/ Hammerson Drive intersection.
